---

- (1) Show the following identity:

$$2n^{n-3} = \sum_{k \geq 0} \binom{n-2}{k} (k+1)^{k-1} (n-k-1)^{n-k-3}.$$

[Hint: Count the number of spanning trees of  $K_n$  containing a fixed edge.]

- (2) Lights Out

- (a) Let the cycle with  $n$  edges and  $n$  vertices be called  $C_n$ . For which  $n \in \mathbb{N}$  is it always possible to turn all lights of the cycle off, no matter which lights are on and/or off? For all other  $n$ , how many combinations of lights that are on and off can be switched off?
- (b) Do the above exercise but instead of the cycle  $C_n$ , consider the hypercube  $H_n$ .

- (3) Counting spanning trees

- (a) Use the Matrix-Tree Theorem to prove Cayley's formula.
- (b) Prove the number of spanning trees of  $K_{n,m}$  obtained in exercise 1 from exercise sheet 3 using the Matrix-Tree Theorem.

- (4) Let  $G = (V, E)$  be a graph and  $F \subset E$  a subset of edges. Show the following statements.

- (a) You can add edges to  $F$  to become a member of the cut space  $S(G)$  if and only if  $F$  does not contain an odd cycle.
- (b) You can add edges to  $F$  to become a member of the cycle space  $Z(G)$  if and only if  $F$  does not contain an odd cut.

[A cut in this context means a member of the cut space, which is what we called an induced cut at some earlier point.]

- (5) Let  $G$  be an undirected graph and  $\vec{G}$  an *orientation* of  $G$ , that is, a graph that contains exactly one of  $(u, v)$  or  $(v, u)$  for each  $\{u, v\} \in E(G)$ . Let  $N$  be the vertex-edge incidence matrix of  $\vec{G}$  and let  $\hat{N}$  be  $N$  without its first row. For any  $F \subseteq E$  we will write  $\hat{N}(F)$  for the matrix with the columns of  $\hat{N}$  that correspond to  $F$ . Let  $F \subset E$  with  $|F| = n - 1$ . When does  $\left(\det\left(\hat{N}(F)\right)\right)^2 = 1$  hold? What else could it be?

[Remark: This can be used to prove the Matrix-Tree theorem for undirected graphs.]
