---

- (1) Suppose  $P$  is a path between two vertices  $u, v$  in a graph  $G$  with  $\kappa(G) \geq 2$ . Prove or disprove: There exists a path  $Q$  which is internally vertex-disjoint from  $P$ .
- (2) Suppose  $G$  has  $\kappa(G) = 2$ .
- (a) Let  $G'$  be obtained from  $G$  by subdividing an edge  $e \in E(G)$  (that is, replacing  $e$  by a path of length 2, see Figure 1). Show that  $\kappa(G') = 2$ .
- (b) Show that any two edges of  $G$  are on a common circle.

Figure 1: Subdividing an edge.

- (3) Let  $T$  be a tree on  $n \geq 3$  vertices and  $x_i = |\{v | d(v) = i\}|$ .
- (a) Show that

$$\sum_{i=3}^{n-1} (i-2)x_i = x_1 - 2$$

- (b) How many non-isomorphic trees with 5 leaves and no vertex of degree 2 exist?
- (4) Let  $G$  be a connected graph that does not contain  $P_4$  or  $K_3$  as induced subgraphs ( $P_4$  is a path with 4 vertices). Prove that  $G$  is a complete bipartite graph.
- (5) The girth of a graph  $G$ , denoted  $g(G)$ , is the length of the shortest cycle in  $G$ .
- (a) Show that if an  $n$ -vertex graph is  $d$ -regular and has girth  $g = 2k + 1$  for  $k \geq 1$ , then

$$n \geq d \sum_{i=0}^{k-1} (d-1)^i + 1.$$

- (b) Provide an example to show the bound is tight when  $d = 3$  and  $g = 5$ .  
[Hint:<http://www.sfu.ca/~agwesolet/Hinweis2>]
